RESEARCH

Overview

Most of my research experience has been in computational physics, with specific applications to astrophysics. In particular, I have experience in:

- Self-consistent solution of the radiative transfer problem, including:
 - dust, with multiple grain sizes, composition, and scattering
 - non-equilibrium (NLTE) line formation, in both static and moving media, including temperature, density, & velocity gradients
 - transiently heated small grains
- Solution of the chemical evolution problem, including:
 - time-dependent & equilibrium chemistry in interstellar clouds
 - chemistry in expanding media, w/ vel., temp., & dens. gradients
 - material surface chemistry for both static and expanding media.
- Solution of the multi-fluid hydrodynamic problem, including
 - stationary solution of the hydrodynamics in CSEs with simple cooling
 - time-dependent solution of multi-fluid hydrodynamics involving sources and flows from acoustic waves through trans- and hyper-sonic (including shocks).

My other research experience is based in both experimental, and computational physics.

- Some experience with Ultra-High Vacuum (UHV) systems, including analysis of High-Resolution Low-Energy Electron Diffraction (HRLEED) measurements of material surfaces and initial considerations of a Scanning Tunneling Microscope (STM) system.
- Construction and testing of particle detectors, for use in medium-energy accelerator.
- Solution for the propagation/interaction of soliton light waves in optical fibers.
- Research in Physics Education, including order of magnitude estimation
- Biophysics, including mechanics and muscle activation in throwing
